

MONITORING THE CROWN JEWELS

Why Law Firms Must Monitor NetDocuments Activity

Executive Summary

Law firms invest heavily in perimeter security, endpoint protection, and email filtering. Yet the system that holds their most sensitive information, NetDocuments, is rarely monitored by a SOC.

This creates a dangerous visibility gap.

Vijilan's NetDocuments Cloud Connector provides real time monitoring, detection, and response for the platform where legal firms store their most valuable data.

The Hidden Risk in Law Firms

The greatest risk to law firms is data theft.

Employees leaving with client data, contractors accessing files they should not, compromised accounts harvesting documents silently, excessive access to sensitive matters, and abuse of administrative privileges.

Why Traditional Security Tools Do Not See This

Firewalls do not see document access. EDR does not understand matter level activity. Email security does not monitor document repositories. NetDocuments operates outside traditional security visibility.

Vijilan's Approach

Vijilan ingests NetDocuments consolidated and administrative audit logs every five minutes into its SIEM platform.

This enables detection of abnormal document activity, monitoring of permission changes, detection of mass downloads and data harvesting, and oversight of administrator actions.

Real World Scenarios

- 1 Insider leaving the firm downloading thousands of files.
- 2 Compromised credentials browsing sensitive folders.
- 3 Privilege abuse through permission changes.
- 4 Monitoring access to high profile matters.

Compliance and Client Trust

Clients ask: "How do you monitor access to our documents?"

With Vijilan: "All NetDocuments activity is monitored by our SOC in real time."

Summary

Law firms cannot afford to leave their most sensitive platform unmonitored.

Vijilan removes one of the largest security blind spots in the legal industry.
